

TOOLS AND THEIR CONFIGURATION USED IN PROJECT

- Naech_K

To ensure uniformity, across media platforms while imitating the attacker's online persona presence I relied on Namechk.com tool to recommend potential usernames and domains linked to a certain keyword.

The screenshot shows the Namechk.com website's Instagram Username Generator. The browser address bar displays 'namechk.com'. The site's navigation bar includes links for 'Domain Names', 'Web Hosting', 'Website Builders', and 'Name Generators'. The main heading is 'INSTAGRAM USERNAME GENERATOR' with a subtext: 'Enter a word and get a list of suggestions with just one click.' A search input field contains the text 'letsleak' and has a magnifying glass icon. Below the input field is a checkbox labeled 'I'm not a robot' and a reCAPTCHA logo. To the right of the input field is an 'Advanced Search' dropdown menu.

The screenshot shows the results page of the Namechk.com Instagram Username Generator. The browser address bar displays 'namechk.com'. The results are presented in a grid of 12 cards, each featuring a star icon, a username, a domain, and a 'Buy' button. The usernames and domains are as follows:

Username	Domain	Status
GorgeousLetsleak	gorgeousletsleak.com	Available
FlyingLetsleak	flyingletsleak.com	Available
BourbonLetsleak	bourbonletsleak.com	Available
SunnyLetsleak	sunnyletsleak.com	Available
LetsleakKarma	letsleakkarma.com	Available
DontFeedTheLetsleak	dontfeedtheletsleak.com	Available
LetsleakLady	letsleaklady.com	Available
BlissOfLetsleak	blissofletsleak.com	Available
RightChoiceLetsleak	rightchoicetsleak.com	Available
LetsleakPumpkin	letsleakpumpkin.com	Available
LetsleakHammock	letsleakhammock.com	Available
WildLetsleak	wildletsleak.com	Available
LetsleakNumber13	letsleaknumber13.com	Available
YoyoLetsleak	yoyoletsleak.com	Available
TakenByLetsleak	takenbyletsleak.com	Available

- HTML and Github pages

To create an community resembling those typically utilized in instances of cyberbullying. This provided a setting, for conducting open source intelligence tracking and collecting evidence based on links.

I enabled the pages through repository settings, made sure that branch was main and source was root. And enforced the HTTPs

<https://letsleakkarma.github.io/Exposing/letsleakkarma.html>

- ExifTool

During the cyberbullying scenario simulation process ExifTool was utilized to examine the metadata of the image labeled as "bells.jpg" .

I used Exiftool which extracts metadata from image to verify the type of image, it's a pre-installed tool in Kali Linux.

```
(kali@kali)-[~/Downloads]
$ exiftool -ver
13.00
```

- FotoForensics

FotoForensics is a tool that is commonly used to spot any alterations made to images by analyzing their compression artifacts

- JPEGsnoop for Linux

JPEG snoop is a tool, for analyzing images that examines and decodes metadata from JPEG images including compression signatures and editing history to ascertain whether an image has been altered or created using software than captured by a camera

```
(kali@kali)-[~/Downloads/jpegsnoop]  
$ wine JPEGsnoop.exe  
█
```

- Sherlock

Sherlock is a tool, for open-source intelligence (OSINT) created to locate usernames on media and online platforms efficiently.

```
(kali@kali)-[~/Downloads/sherlock]
$ sherlock_project

(kali@kali)-[~/Downloads/sherlock/sherlock_project]
$ sherlock letsleakkarma
```

Google Reverse Image search

To confirm if the image is authentic and check for any circulation aiding in tracking its source or detecting any possible editing or reuse.

I first navigated to Google Images, then clicked on icon to Search by image.

I uploaded the picture I downloaded from the form to see whether image was published previously. Google found the image, in an article named "Women drinkers 'given a bad press'" by The Independent, published in 2011.

News > Media > Press

Women drinkers 'given a bad press'

Report highlights double standards in the way media portray young people and celebrities

Mary Dejevsky • Sunday 04 September 2011 00:00 BST • [Comments](#)

- dd Tool

It is tool based on Unix command line to make bit by bit disk image to preserve evidence. I utilized the 'dd' command to generate a raw disk image named 'evidence.dd' of the Evidence directory to mimic the process of creating a disk image. This step guarantees that the data is conserved in an unmodifiable form a crucial aspect, for upholding the chain of custody effectively.

```
(kali@kali)-[~/Desktop]
$ dd if=/dev/zero of=evidence.dd bs=1M count=20
mkfs.vfat evidence.dd

20+0 records in
20+0 records out
20971520 bytes (21 MB, 20 MiB) copied, 0.0187255 s, 1.1 GB/s
mkfs.fat 4.2 (2021-01-31)

(kali@kali)-[~/Desktop]
$ sudo mkdir -p /mnt/evidence_mount
sudo mount -o loop evidence.dd /mnt/evidence_mount

(kali@kali)-[~/Desktop]
$ sudo cp -r ~/Desktop/Evidence/* /mnt/evidence_mount/

(kali@kali)-[~/Desktop]
$ sudo umount /mnt/evidence_mount
```

- Sha256s sum

The sha256sum program is a tool that is commonly used through the command line to create and validate SHA256 hash values ensuring the security and trustworthiness of files by generating a digital signature for verification purposes. Once I created the evidence.dd I generated the SHA256 to make sure that its integrity will be preserved.

sha256sum evidence.dd > evidence_hash.txt
